Real-device test plan (45 minutes)

Status: not done. Everything so far ran in headless Chrome on a laptop. This checklist is for one real Android phone (Chrome) and, if possible, one iPhone (Safari). Tick each box per device and write what you saw. Use a test SIM or Wi-Fi only; never press a real 112 / 108 call to the end (see step 3).

Setup (5 min): start the mock on a laptop on the same Wi-Fi (`npm run mock`), build the app with `VITE_API_URL=http://<laptop-ip>:4000 VITE_DEMO_TOOLS=true`, serve it over HTTPS (a tunnel or a deployed preview; install and notifications need HTTPS), open it on the phone. Sign in `patient@demo.test` / `demo1234`.

#	Check	Android	iPhone	What to write down
1	**Install the PWA** (Chrome: Install app; Safari: Share > Add to Home Screen). Opens full screen with the icon and name "HealthTwin"	[ ]	[ ]	Icon sharp? Splash? Status bar colour?
2	**Layout** at the real screen size: Home, Symptoms, Emergency, Profile, Contacts. No sideways scroll, thumbs reach the main buttons	[ ]	[ ]	Any text cut off? Notch or home-bar overlap?
3	**Call 112 / 108** button opens the dialer with 112 filled in. Cancel the call in the dialer	[ ]	[ ]	Does it open at once with no network?
4	**Offline**: switch on airplane mode, open the installed app	[ ]	[ ]	App opens? Saved screens readable?
5	Offline, press Emergency help > Get help now > Send now	[ ]	[ ]	Does it say "Not sent yet" (never "sent")? Is Call 112 / 108 first?
6	**SMS fallback**: tap "Tell your contacts by SMS"	[ ]	[ ]	Messages app opens with the text and the contact numbers? Android uses `sms:` with `?body=`, iPhone with `&body=`; note which worked. Text includes a maps link?
7	Back online: the alert sends by itself	[ ]	[ ]	How many seconds?
8	**Safety check-in**: Profile > turn on; `/demo` > Simulated fall. Full-screen "Are you OK?"	[ ]	[ ]	Is the beep audible? Does it vibrate (Android yes, iPhone Safari usually no)? Is "I'm OK" easy to hit?
9	Let the check-in time out: an alert starts, source "Safety check-in"	[ ]	[ ]	Screen stays on?
10	**Countdown sound and vibration** in a normal emergency (10 s)	[ ]	[ ]	Sound with the ringer off? With the screen locked for 5 s?
11	**Reminders**: create one 2 minutes ahead, app open	[ ]	[ ]	Alert shown? Sound?
12	Reminder with the app in a **hidden tab** (switch app for 3 min)	[ ]	[ ]	Fired late or never? (The app says reminders only work while it is open.)
13	**Notifications**: allow when asked; trigger a hospital-acknowledged event (`/demo` scenario) while the app is in the background	[ ]	[ ]	Notification appears? Tapping opens the right screen? Denied permission handled calmly?
14	**Location**: Emergency with location consent on, outdoors if possible	[ ]	[ ]	"Using your location" or demo location? Accuracy? Denied permission message?
15	**Voice** symptom entry in Hindi and Gujarati	[ ]	[ ]	Does the phone have those voices? Are ticked symptoms right?
16	**QR passport**: Profile > Health passport > create; scan with a second phone's camera	[ ]	[ ]	Opens the responder page? Readable in sunlight (brightness)? Link expires?
17	**Screen reader** (TalkBack or VoiceOver) on Home and Emergency	[ ]	[ ]	Every button spoken with a name? Order sensible?
18	**Large text** (system font size to maximum)	[ ]	[ ]	Layout survives?
19	**Slow network** (data saver or 2G/3G) on Emergency send	[ ]	[ ]	Spinner and "Sending..." not stuck?
20	**Battery and heat** after 10 minutes of use	[ ]	[ ]	Any drain or heat?

Report back

Device, OS and browser version for each phone; the numbers of failed rows; a screenshot or phone video of every failure; anything confusing a non-technical person would trip on. File findings as notes in `docs/RELEASE_CHECKLIST.md` (section "Real devices") and do not change code until the list is reviewed.

Known limits (do not report as bugs)

Reminders and the check-in only work while the app is open. iPhone Safari does not support vibration and limits web notifications to installed web apps. SMS only opens the Messages app; nothing is sent for the user. All hospital and ambulance activity is simulated.
